Robustness of $\lambda$-tracking in the gap metric

Achim Ilchmann* Markus Mueller*

28 August 2007

Abstract

For $m$-input, $m$-output, finite-dimensional, linear systems satisfying the classical assumptions of adaptive control (i.e., (i) minimum phase, (ii) relative degree one and (iii) “positive” high-frequency gain), it is well known that the adaptive $\lambda$-tracker $u = -k e$, $k = \max\{0, |e| - \lambda\} e$, achieves $\lambda$-tracking of the tracking error $e$ if applied to such a system: all states of the closed-loop system are bounded and $|e|$ is ultimately bounded by $\lambda$, where $\lambda > 0$ is prespecified and may be arbitrarily small.

Invoking the conceptual framework of nonlinear gap metric, we show that the $\lambda$-tracker is robust. In the present setup this means in particular that the $\lambda$-tracker copes with bounded input and output disturbances and, more importantly, it may even be applied to a system not satisfying one of the classical conditions (i)-(iii) as long as the initial conditions and the disturbances are “small” and the system is “close” (in terms of “small” gap) to a system satisfying (i)-(iii).

Nomenclature

$\mathbb{C}_+$, $\mathbb{C}_-$ = $\{s \in \mathbb{C} \mid \text{Re } s > 0\}$, $\{s \in \mathbb{C} \mid \text{Re } s < 0\}$, respectively

$A > 0$ if, and only if, $x^T A x > 0$ for all $x \in \mathbb{R}^n \setminus \{0\}$, where $A = A^T \in \mathbb{R}^{n \times n}$

$|x|$ = $\sqrt{x^T x}$, the Euclidean norm of $x \in \mathbb{R}^n$

$|A|$ = $\max \{|A x| \mid x \in \mathbb{R}^m, |x| = 1\}$, the induced matrix norm for $A \in \mathbb{R}^{n \times m}$

$\|v\|_V$ the norm of $v \in V$, for any normed vector space $V$

$L^p(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)$ the space of $p$-integrable functions $y : \mathbb{R}_{\geq 0} \to \mathbb{R}^\ell$, $1 \leq p < \infty$, with norm

$\|y\|_{L^p(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)} = \left( \int_0^\infty |y(t)|^p \, dt \right)^{\frac{1}{p}}$

$L^p_{\text{loc}}(I \to \mathbb{R}^\ell)$ the space of locally $p$-integrable functions $y : I \to \mathbb{R}^\ell$, with $\int_K |y(t)|^p \, dt < \infty$ for all compact $K \subset I$, where $1 \leq p < \infty$ and $I \subset \mathbb{R}_{\geq 0}$ is an interval

$L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)$ the space of essentially bounded functions $y : \mathbb{R}_{\geq 0} \to \mathbb{R}^\ell$, with norm

$\|y\|_{L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)} = \text{ess sup}_{t \geq 0} |y(t)|$

$L^\infty_{\text{loc}}(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)$ the space of locally bounded functions $y : I \to \mathbb{R}^\ell$ with $\text{ess sup}_{t \in K} |y(t)| < \infty$ for all compact $K \subset I$, $I \subset \mathbb{R}_{\geq 0}$ is an interval

$W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)$ the Sobolev space of absolutely continuous functions $y : \mathbb{R}_{\geq 0} \to \mathbb{R}^\ell$ with $y, \dot{y} \in L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)$ and norm

$\|y\|_{W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)} = \|y\|_{L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)} + \|\dot{y}\|_{L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^\ell)}$

$W^{1,\infty}_{\text{loc}}(I \to \mathbb{R}^\ell)$ the space of absolutely continuous functions $y : I \to \mathbb{R}^\ell$ with $y, \dot{y} \in L^\infty_{\text{loc}}(I \to \mathbb{R}^\ell)$, $I \subset \mathbb{R}_{\geq 0}$ an interval

$\text{dist}(e, [-\lambda, \lambda]) = \max\{0, |e| - \lambda\}$ for $e \in \mathbb{R}^m$ and $\lambda > 0$

$d_\lambda(e) = \max\{0, |e| - \lambda\}$ for $e \in \mathbb{R}^m$ and $\lambda > 0$.

1 Introduction

In this paper we show robustness of $\lambda$-stabilization and $\lambda$-tracking (i.e. stabilization and tracking with a final accuracy of prespecified $\lambda > 0$) for linear $n$-dimensional, $m$-input, $m$-output systems of the form

$$
\begin{align*}
\dot{x}(t) &= Ax(t) + Bu_1(t), \quad x(0) = x^0, \\
y_1(t) &= Cx(t),
\end{align*}
$$

(1.1)

where $A \in \mathbb{R}^{n \times n}$, $B, C^T \in \mathbb{R}^{n \times m}$, $x^0 \in \mathbb{R}^n$, subject to additive input/output disturbances $u_0, y_0$, respectively,

$$
\begin{align*}
u_0 &= u_1 + u_2, \\
y_0 &= y_1 + y_2,
\end{align*}
$$

(1.2)

as depicted in Figure 1, where the plant $P$ maps the interior input signal $u_1$ to the interior output signal $y_1$ and the controller $C$ maps the interior output-signal $y_2$ to the interior input signal $u_2$. In our setup $P$ will always be a linear initial value problem of the form (1.1) and the controller $C$ will be a dynamical system, specified in due course.

![Figure 1: The closed-loop system $[P,C]$.](image)

Note that the state space dimension $n \in \mathbb{N}$ needs not to be known but the input/output dimension $m \in \mathbb{N}$ must be known.

It is well known that (1.1) can be stabilized, in case of zero disturbances $u_0 \equiv y_0 \equiv 0$, by proportional high-gain ($k \gg 0$) output feedback

$$
u_2(t) = -ky_2(t),
$$

(1.3)

provided (1.1) is minimum phase, i.e.

$$
\forall s \in \mathbb{C}_+ : \det \begin{bmatrix} sI - A & B \\ C & 0 \end{bmatrix} \neq 0,
$$

and its transfer function $C(sI - A)^{-1}B$ has strict relative degree one with “positive” high-frequency gain, i.e. $CB + (CB)^T > 0$.

If only these structural assumptions but no system entries are known, i.e. we study, for $n, m \in \mathbb{N}$ with $n \geq m$, the system class

$$
\tilde{M}_{n,m} := \left\{(A, B, C) \in \mathbb{R}^{n \times n} \times \mathbb{R}^{n \times m} \times \mathbb{R}^{m \times n} \mid \begin{bmatrix} CB + (CB)^T > 0, \\
\forall s \in \mathbb{C}_+ : \det \begin{bmatrix} sI_n - A & B \\ C & 0 \end{bmatrix} \neq 0 \right\},
$$

then any $(A, B, C) \in \tilde{M}_n$ can be stabilized adaptively, in the presence of $L^2$ input/output disturbances, by the controller (ubiquitous in the adaptive control literature)

$$
\begin{align*}
\dot{k}(t) &= |y_2(t)|^2, \\
k(0) &= k^0 \in \mathbb{R} \\
u_2(t) &= -k(t)y_2(t),
\end{align*}
$$

(1.4)
in the sense that all states of the closed-loop system (1.1), (1.2), (1.4) are bounded and \( \lim_{t \to \infty} y_1(t) = 0 \). This approach has been introduced by the seminal work of [14, 15, 18], see also the survey [7].

The surprising property of the controller (1.4) is not only its simplicity but also its robustness: it is also applicable in the presence of additive \( L^2 \) input/output disturbances and it may stabilize systems (1.1) not belonging to \( \tilde{\mathcal{M}}_{n,m} \) but sufficiently "close" – in terms of the gap metric defined in Section 3 – to some \((A, B, C)\) in normal form and belonging to \( \tilde{\mathcal{M}}_{n,m} \). This has been proved in [4].

However, the controller (1.4) has the shortcomings that, if tracking is the control objective, it needs to be combined with an internal model (thus becoming more involved) and, more importantly, fails for stabilizing non-linear systems or in the presence of additive arbitrarily small input or output disturbances. To overcome these shortcomings, the so called \( \lambda \)-tracker

\[
\begin{align*}
\dot{k}(t) &= \text{dist}(y_2(t), [-\lambda, \lambda]) \cdot \vert y_2(t) \vert, \quad k(0) = k^0, \\
u_2(t) &= -k(t)y_2(t),
\end{align*}
\]  

(1.5)

for \( \lambda > 0, \quad k^0 \in \mathbb{R} \), has been introduced by [10].

The application of the \( \lambda \)-tracker (1.5) to any system (1.1) belonging to \( \tilde{\mathcal{M}}_{n,m} \), via (1.2), satisfies, in the presence of arbitrary input/output disturbances \( u_0, y_0 \) which are bounded with essentially bounded derivative, arbitrary initial conditions \( x_0 \in \mathbb{R}^n, \quad k^0 \in \mathbb{R} \) and any arbitrarily small design parameter \( \lambda > 0 \), the control objectives of \( \lambda \)-tracking:

- all signals and their derivatives of the closed-loop system (1.1), (1.2), (1.5) are bounded;
- \( \limsup_{t \to \infty} \text{dist}(y_2(t), [-\lambda, \lambda]) = 0 \).

This result has been generalized to nonlinear and infinite dimensional systems [11] and applied, to name but a few, to regulate biogas tower reactors [9], chemical reactors [12], insulin delivery for diabetic patients [2] by preserving the simplicity of the control strategy.

Note also that it is a tracking result without invoking an internal model: set \( y_0(\cdot) \equiv y_{\text{ref}}(\cdot) \) as a prespecified reference signal.

The purpose of the present paper is to show robustness properties of the \( \lambda \)-tracker in terms of the gap metric. For example, we consider

\[
\begin{align*}
\dot{x} &= \tilde{A} x + \tilde{b} u_1, \quad x(0) = \bar{x}^0, \\
y_1 &= \tilde{c} x,
\end{align*}
\]  

(1.6)

with \( \bar{x}^0 \in \mathbb{R}^3 \) and where, for \( \alpha, N, M > 0 \),

\[
\tilde{A} := \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \alpha N M & -N M + \alpha N + \alpha M & \alpha - N - M \end{bmatrix}, \quad \tilde{b} := \begin{bmatrix} 0 \\ 0 \\ N \end{bmatrix}, \quad \tilde{c} := [M, -1, 0].
\]

This system does not belong to the class \( \tilde{\mathcal{M}}_{3,1} \), its transfer function \( \frac{N(M-s)}{(s-\alpha)(s+N)(s+M)} \) does not satisfy any of the classical structural assumptions in adaptive control:

- it is not minimum phase;
- it has relative degree two;
- and its high frequency-gain \(-N < 0\) has the “wrong” sign.

(1.7)
However, defining, for \( n, m \in \mathbb{N} \) with \( n \geq m \), the system class
\[
\mathcal{P}_{n,m} := \{(A, B, C) \in \mathbb{R}^{n \times n} \times \mathbb{R}^{n \times m} \times \mathbb{R}^{m \times n} \mid (A, B, C) \text{ is stabilizable and detectable}\},
\]
(1.6) belongs to \( \mathcal{P}_{3,1} \) and we will show in Sub-section 3.5 and Example 4.6 that (1.6) is close (in terms of the gap metric) to a system belonging to \( \mathcal{M}_{1,1} \) for \( N, M \) sufficiently large and \( \bar{x}^0 \) sufficiently small, and thus (1.5) applied to (1.6) achieves \( \lambda \)-tracking.

Instead of systems \((A, B, C) \in \mathcal{M}_{n,m}\) we restrict our attention to systems in Byrnes-Isidori normal form, for example see [13, Section 4]. That is, for each \((A, B, C) \in \mathcal{M}_{n,m}\) the matrix
\[
T = [B(CB)^{-1}, V],
\]
where \( V \in \mathbb{R}^{n \times (n-m)} \) satisfies \( \text{im} = \ker C \) and rank \( V = n-m \), converts (1.1) via the coordinate transformation \((y_1, z) = T^{-1}x\) into
\[
y_1' = A_1y_1 + A_2z + CBu_1, \quad y_1(0) = y_1^0 \in \mathbb{R},
\]
\[
z' = A_3y_1 + A_4z, \quad z(0) = z^0 \in \mathbb{R}^{n-m},
\]
where
\[
\begin{bmatrix} A_1 & A_2 \\ A_3 & A_4 \end{bmatrix} := T^{-1}AT, \quad \begin{bmatrix} B_1 \\ 0_{(n-m) \times m} \end{bmatrix} := \begin{bmatrix} CB \\ 0 \end{bmatrix} = T^{-1}B, \quad \begin{bmatrix} I_m & 0_{m \times (n-m)} \end{bmatrix} = CT.
\]

By the minimum-phase property, \( A_4 \) has spectrum in the open left half complex plane \( \mathbb{C}_- \). Therefore, we introduce, for \( n, m \in \mathbb{N} \) with \( n \geq m \), the system class
\[
\mathcal{M}_{n,m} := \{(A, B, C) \in \mathbb{R}^{n \times n} \times \mathbb{R}^{n \times m} \times \mathbb{R}^{m \times n} \mid A = \begin{bmatrix} A_1 & A_2 \\ A_3 & A_4 \end{bmatrix}, \quad B = \begin{bmatrix} B_1 \\ 0 \end{bmatrix}, \quad C = \begin{bmatrix} I_m \\ 0 \end{bmatrix}, \quad B_1, A_i \in \mathbb{R}^{m \times m}, \quad \text{spec}(A_4) \subset \mathbb{C}_-, \quad B_1 + B_1^T > 0 \}.
\]

We will study properties of the closed-loop system generated by the application of the \( \lambda \)-tracker (1.5) to systems (1.1) of class \( \mathcal{M}_{n,m} \) or of class \( \mathcal{P}_{n,m} \) in the presence of disturbances \((u_0, y_0) \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)\) satisfying the interconnection equations (1.2).

The closed-loop system (1.8), (1.5), (1.2) is depicted in Figure 2.

![Figure 2: The adaptive closed-loop system.](image)

The paper is organized as follows. In Section 2 we show that \( \lambda \)-tracking is possible for all linear systems (1.1) belonging to class \( \mathcal{M}_{n,m} \) in the presence of \( W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \) input/output disturbances, see Figure 2. In Section 3 we collect the basics of the framework of gap metric
and graph topology necessary for our setup. The final Section 4 contains our main result, i.e. robustness of λ-tracking. We show that if the initial conditions, input/output-disturbances and, for \( m, q, n \in \mathbb{N} \) with \( q, n \geq m \), the gap between a nominal system belonging to class \( \mathcal{P}_{q,m} \) and a system belonging to class \( \mathcal{M}_{n,m} \), are sufficiently small, then the controller (1.5) achieves λ-tracking for the nominal system.

## 2 λ-tracking

In this section we show that the control strategy given by (1.5) applied to any linear system of class \( \mathcal{M}_{n,m} \) achieves λ-tracking in the presence of \( W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \) input/output disturbances, see Figure 2. Set, for \( n, m \in \mathbb{N} \) with \( n \geq m \),

\[
\mathcal{D}_{n,m} := \mathcal{M}_{n,m} \times (\mathbb{R}^m \times \mathbb{R}^{n-m} \times \mathbb{R}) \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m).
\]

**Proposition 2.1** Let \( m, n \in \mathbb{N} \) with \( n \geq m \) and \( \lambda > 0 \). Then there exists a continuous map \( \nu: \mathcal{D}_{n,m} \to \mathbb{R}_{\geq 0} \) such that, for all \( d = \left( \begin{bmatrix} A_1 & A_2 \\ A_3 & A_4 \end{bmatrix}, B, C, (y_1^0, z^0, k^0), u_0, y_0 \right) \in \mathcal{D}_{n,m} \), the associated closed-loop initial value problem (1.8), (1.2), (1.5) satisfies

\[
\|(u_2, y_2, z, k)\|_{W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^{m+n+1})} \leq \nu(d) \tag{2.1}
\]

and

\[
\limsup_{t \to \infty} |y_2(t)| \leq \lambda. \tag{2.2}
\]

The result that λ-tracking works for the class of systems \( \mathcal{M}_n \) goes back to [10] and input disturbances are also considered in [8]. However, to prove robustness of the λ-tracker in Section 4, the existence of a continuous function \( \nu(\cdot) \) satisfying (2.1) is crucial. Therefore, we had to find a new proof showing (2.1) which easily shows 2.2.

**Proof of Proposition 2.1.** Let \( d = \left( \begin{bmatrix} A_1 & A_2 \\ A_3 & A_4 \end{bmatrix}, B, C, (y_1^0, z^0, k^0), u_0, y_0 \right) \in \mathcal{D}_{n,m} \) and set, for notational convenience,

\[
h(\cdot) := \dot{y}_0(\cdot) - A_1 y_0(\cdot) - CBu_0(\cdot),
\]

\[
e(\cdot) := y_2(\cdot).
\]

The closed-loop initial value problem (1.8), (1.2), (1.5) is then given by

\[
\begin{align*}
\dot{e} &= A_1 e - A_2 z - k CB e + h, \quad e(0) = e^0 := y_0(0) - y_1^0 \\
\dot{z} &= -A_3 e + A_4 z + A_3 y_0, \quad z(0) = z^0 \\
\dot{k} &= d_\lambda(e) |e|, \quad k(0) = k^0,
\end{align*}
\tag{2.3}
\]

where \( d_\lambda \) is defined in the Nomenclature. We divide the proof into ten steps.

**Step 1:** Since the right hand side of (2.3) is continuous and locally Lipschitz, it follows from the theory of ordinary differential equations that (2.3) has a solution

\[
(e, z, k): [0, \omega) \to \mathbb{R}^{n-m} \times \mathbb{R}^m \times \mathbb{R}_{\geq 0}
\]

on a maximal interval of existence \([0, \omega)\) for some \( \omega \in (0, \infty] \). This solution is unique.

**Step 2:** We define some constants that are used in the following steps of the proof.

Since \( \text{spec}(A_4) \subset \mathbb{C}_- \) we have

\[
\exists M_1, \mu > 0 \quad \forall t \geq 0 : |\exp(A_4 t)| \leq M_1 \exp(-\mu t). \tag{2.4}
\]
Set
\[ \sigma_1 := \min \text{spec} (CB + (CB)^T)/2 \]
\[ M_2 := M_1 + M_1 |A_3|(\|y_0\|_{L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)} + \lambda + \mu)/\mu \]
\[ M_3 := M_2 (1 + |z^0|)/\lambda + M_2 (1 + 1/\mu) \]
\[ M_4 := |A_1| + |A_2| + \|h\|_{L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)}/\lambda \]
\[ M_5 := |k^0| + 2(M_4 + M_3M_4 + 1)/\sigma_1 \]
\[ M_6 := M_5 + |k^0| + |e^0|^2/2 \]
\[ M_7 := (d_\lambda(e^0)^2 + 2(M_6 + |k^0|)|\sigma_1 (M_6 + |k^0|)/2 + M_4 + M_3M_4|^{1/2} + \lambda \]
\[ M_8 := M_2 (1 + |z^0| + M_7/\mu). \]

Step 3: We estimate the z-dynamics in the form
\[ \forall \ t \in [0, \omega) : \int_0^t d_\lambda(e(\tau)) |z(\tau)| \, d\tau \leq M_3 \left[ k(t) - k^0 \right]. \quad (2.5) \]

Applying Variation of Constants to the second equation in (2.3) and invoking (2.4) gives, for all \( t \in [0, \omega) \),
\[ |z(t)| \leq M_1 e^{-\mu t} |z^0| + \int_0^t M_1 e^{-\mu(t-\tau)} |A_3| \left( |e(\tau)| + |y_0(\tau)| \right) \, d\tau \]
\[ \leq M_1 e^{-\mu t} |z^0| + M_1 |A_3| \int_0^t e^{-\mu(t-\tau)} \left( d_\lambda(e(\tau)) + \|y_0\|_{L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)} + \lambda \right) \, d\tau \]
\[ \leq M_1 e^{-\mu t} |z^0| + M_1 |A_3| \int_0^t e^{-\mu(t-\tau)} |y_0|_{L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)} \, d\tau \]
\[ + M_1 |A_3| \int_0^t e^{-\mu(t-\tau)} \lambda \, d\tau + M_1 |A_3| \int_0^t e^{-\mu(t-\tau)} d_\lambda(e(\tau)) \, d\tau \]
\[ \leq M_1 |z^0| + \frac{M_1 |A_3|}{\mu} \left( \|y_0\|_{L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)} + \lambda \right) + M_1 |A_3| \int_0^t e^{-\mu(t-\tau)} d_\lambda(e(\tau)) \, d\tau \]
\[ \leq M_2 \left[ 1 + |z^0| + \int_0^t e^{-\mu(t-\tau)} d_\lambda(e(\tau)) \, d\tau \right]. \quad (2.6) \]

Let
\[ \forall \ t \in [0, \omega) \ \forall \ \varphi \in L^2_{\text{loc}}(\mathbb{R}_{\geq 0} \to \mathbb{R}) : (L * \varphi)(t) := \int_0^t e^{-\mu(t-\tau)} \varphi(\tau) \, d\tau. \]

Invoking the well known inequality, see for example [17, p. 298],
\[ \forall \ t \geq 0 : \|L * \varphi\|_{L^2([0,t) \to \mathbb{R})} \leq \left\| e^{-\mu \cdot} \right\|_{L^1(\mathbb{R}_{\geq 0} \to \mathbb{R})} \|\varphi\|_{L^2([0,t) \to \mathbb{R})} = \frac{1}{\mu} \|\varphi\|_{L^2([0,t) \to \mathbb{R})} \]
and the fact that
\[ \forall \ e \in \mathbb{R} : d_\lambda(e)^2 \leq d_\lambda(e) |e|. \]
yields, by (2.3), (2.6) and the Cauchy-Schwarz inequality, for all \( t \in [0, \omega) \)
\[ \int_0^t d_\lambda(e(\tau)) |z(\tau)| \, d\tau \leq M_2 \int_0^t d_\lambda(e(\tau)) \left[ 1 + |z^0| + (L * d_\lambda(e))(\tau) \right] \, d\tau \]
\[ \leq M_2 \left[ 1 + |z^0| \right] \frac{1}{\lambda} \int_0^t d_\lambda(e(\tau)) |e(\tau)| \, d\tau \]
\[ + M_2 \left[ \|d_\lambda(e)\|_{L^2([0,t) \to \mathbb{R})}^2 + \|L * d_\lambda(e)\|_{L^2([0,t) \to \mathbb{R})}^2 \right] \]
\[ \leq M_2 \left[ 1 + |z^0| \right] \frac{1}{\lambda} \int_0^t d_\lambda(e(\tau)) |e(\tau)| \, d\tau + M_2 \left( 1 + \frac{1}{\mu} \right) \int_0^t d_\lambda(e(\tau))^2 \, d\tau. \]
This proves (2.5).

**Step 4:** We estimate the $e$-dynamics in the form

$$
\forall \ t \in [0, \omega) : \ \frac{1}{2} \frac{d}{dt} (\frac{1}{2} d_{\lambda}(e(t))^2) \leq \frac{1}{2} d_{\lambda}(e^0)^2 - (k(t) - k^0) \left[ \frac{\sigma_1}{2} (k(t) + k^0) \right] - M_4 - M_3 M_4 \ .
$$

(2.7)

By (2.3) and Step 2 we have, omitting the argument $t$,

$$
\frac{d}{dt} \left( \frac{1}{2} d_{\lambda}(e(t))^2 \right) = d_{\lambda}(e) \ |e|^{-1} e^T \dot{e}
\leq d_{\lambda}(e) \ |e|^{-1} e^T [A_1 e - A_2 z - k \ C B e + h]
\leq d_{\lambda}(e) \ |e| \ |A_1| + d_{\lambda}(e) \ |z| \ |A_2| + d_{\lambda}(e) \ |h| \ L^\infty(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^m)
- k \ d_{\lambda}(e) \ |e|^{-1} e^T (\frac{1}{2} (C B + (C B)^T) e)
\leq - (k \ \sigma_1 - |A_1|) d_{\lambda}(e) \ |e| + |A_2| d_{\lambda}(e) \ |z| + d_{\lambda}(e) \ |h| \ L^\infty(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^m)
\leq - (k \ \sigma_1 - M_4) d_{\lambda}(e) \ |e| + M_4 \ d_{\lambda}(e) \ |z|
\, ,
$$

and hence, by integration and invoking (2.5) we arrive at

$$
\forall \ t \in [0, \omega) : \ \frac{1}{2} d_{\lambda}(e(t))^2 \leq \frac{1}{2} d_{\lambda}(e^0)^2 - \int_0^t (k(\tau) \ \sigma_1 - M_4) k(\tau) \ d\tau + M_3 M_4 [k(t) - k^0]
$$

which yields (2.7).

**Step 5:** We show boundedness of $k$ in the form

$$
\forall \ t \in [0, \omega) : \ k(t) \leq M_6 \ .
$$

(2.8)

Suppose there exists $T \in [0, \omega)$ such that $k(T) = M_5$, otherwise (2.8) is obvious. Then, by monotonicity of $k$, it follows from (2.7) that, for all $t \in [T, \omega)$,

$$
0 \leq \frac{1}{2} d_{\lambda}(e(t))^2 \leq \frac{1}{2} d_{\lambda}(e^0)^2 - \frac{\sigma_1}{2} (k(t) - k^0) \left[ k(t) + k^0 - \frac{2}{\sigma_1} (M_4 + M_3 M_4) \right]
\leq \frac{1}{2} d_{\lambda}(e^0)^2 - \frac{\sigma_1}{2} (k(t) - k^0) \left[ M_5 + k^0 - \frac{2}{\sigma_1} (M_4 + M_3 M_4) \right]
= \frac{1}{2} d_{\lambda}(e^0)^2 - \frac{\sigma_1}{2} (k(t) - k^0) \left[ |k^0| + k^0 + \frac{2}{\sigma_1} \right]
\leq \frac{1}{2} d_{\lambda}(e^0)^2 - (k(t) - k^0) \, ,
$$

and thus

$$
\forall \ t \in [T, \omega) : \ k(t) - k^0 \leq \frac{1}{2} d_{\lambda}(e^0)^2 \leq \frac{1}{2} |e^0|^2
$$

and

$$
\forall \ t \in [0, T) : \ k(t) - k^0 \leq M_5 - k^0
\, ,
$$

whence (2.8).

**Step 6:** We show boundedness of $e$ in the form

$$
\forall \ t \in [0, \omega) : \ |e(t)| \leq M_7
\, .
$$

(2.9)
An application of (2.8) to (2.7) gives, for all \( t \in [0, \omega) \),
\[
|e(t)| \leq d_\lambda(e(t)) + \lambda \leq \left( d_\lambda(e(0))^2 - 2 \left( k(t) - k^0 \right) \left[ \frac{\sigma_1}{2} (k(t) + k^0) - M_4 - M_3 M_4 \right] \right)^{\frac{1}{2}} + \lambda \\
\leq \left( d_\lambda(e(0))^2 + 2(M_6 + k^0) \left[ \frac{\sigma_1}{2} (M_6 + |k^0|) + M_4 + M_3 M_4 \right] \right)^{\frac{1}{2}} + \lambda.
\]

Note that the argument of the root in the second line is nonnegative, see Step 5. Now (2.9) follows from Step 2.

**Step 7:** Boundedness of \( z \) in the form
\[
\forall t \in [0, \omega) : |z(t)| \leq M_2 \left[ 1 + |z^0| + \int_0^t e^{-\mu(t-\tau)} M_7 d\tau \right] \leq M_8 \tag{2.10}
\]
follows from applying (2.9) to (2.6).

**Step 8:** We show \( \omega = \infty \).
Since \( \omega \) was chosen maximal, (2.8)–(2.10) yield \( \omega = \infty \).

**Step 9:** We show (2.1).
It follows from Step 5–8 that \( (u_2, y_2, z, k) \) is uniformly bounded in terms of \( d = \left( \left[ \begin{array}{cc} A_1 & A_2 \\ A_3 & A_4 \end{array} \right] , B, C, (y_1^0, z^0, k^0), u_0, y_0 \right) \). Moreover, applying Step 5–8 again and invoking (2.3) yields uniform boundedness of \( (\dot{u}_2, \dot{y}_2, \dot{z}, \dot{k}) \) in terms of \( d \). Now the existence of a continuous function \( \nu : \mathcal{D}_{n,m} \rightarrow \mathbb{R}_{\geq 0} \) such that (2.1) holds is straightforward by invoking the constants from Step 2.

**Step 10:** We show (2.2).
Since \( k \in L^\infty(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}) \) by (2.1) it follows from \( \|d_\lambda(y_2)\|_{L^1([0,t) \rightarrow \mathbb{R})} = k(t) - k^0 \) that \( d_\lambda(y_2)\|_{L^1(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R})} \). Since \( y_2 \in W^{1,\infty}(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^m) \) there exists \( M > 0 \) such that \( \text{ess sup}_{t \geq 0} |(\dot{y}_2)_i(t)| < M \), for all \( i \in \{1, \ldots, m\} \), which gives
\[
\forall s \geq 0 \forall i \in \{1, \ldots, m\} \forall t \in [0, s) \exists \tau_i \in (t, s) : (\dot{y}_2)_i(\tau_i) = \frac{(y_2)_i(s) - (y_2)_i(t)}{s - t} < M
\]
and so
\[
\forall i \in \{1, \ldots, m\} \forall t \in [0, s) : |(y_2)_i(s) - (y_2)_i(t)| < M(s - t).
\]
For \( \delta = \frac{\varepsilon}{M} \) we arrive at
\[
\forall i \in \{1, \ldots, m\} \forall \varepsilon > 0 \exists \delta > 0 \forall t, s \in \mathbb{R}_{\geq 0} \text{ with } |t - s| < \delta : |(y_2)_i(t) - (y_2)_i(s)| < \varepsilon,
\]
i.e., \( y_2 \) is uniformly continuous. Boundedness and uniform continuity of \( y_2 \) and the continuity of \( e \mapsto d_\lambda(e) \) \( e \) gives uniform continuity of \( t \mapsto d_\lambda(y_2(t)) \) \( y_2(t) \). So Barbâlat’s Lemma, see [1], gives
\[
\lim_{t \to \infty} d_\lambda(y_2(t)) \|y_2(t)\| = 0,
\]
which yields (2.2), and completes the proof. \( \square \)

### 3 The concept of gap metric

The material in this section is based on [6, Section II], [4, Section 2] and [3, Section 2] and contains the fundamental results necessary for proving robustness in Section 4.
3.1 Terminology

Let \( \mathcal{X} \) be a nonempty set and, for \( 0 < \omega \leq \infty \), let \( \mathcal{S}_\omega \) denote the set of locally integrable maps \( [0, \omega) \to \mathcal{X} \). For simplicity, we write \( \mathcal{S} := \mathcal{S}_\infty \). For \( 0 < \tau < \omega \leq \infty \), \( T_\tau : \mathcal{S}_\omega \to \mathcal{S} \) denotes the operator given by

\[
T_\tau v := \begin{cases} 
v(t), & t \in [0, \tau) \\
0, & t \in [\tau, \infty). 
\end{cases}
\]

With \( \mathcal{V} \subset \mathcal{S} \) we associate spaces as follows:

\[
\mathcal{V}_e = \{ v \in \mathcal{S} \mid \forall \tau > 0 : T_\tau v \in \mathcal{V} \}, \quad \text{the extended space} ;
\]

\[
\mathcal{V}_\omega = \{ v \in \mathcal{S}_\omega \mid \forall \tau \in (0, \omega) : T_\tau v \in \mathcal{V} \}, \quad 0 < \omega \leq \infty ;
\]

\[
\mathcal{V}_a = \bigcup_{\omega \in (0, \infty]} \mathcal{V}_\omega, \quad \text{the ambient space}.
\]

If \( v, w \in \mathcal{V}_a \) with \( v|_I = w|_I \) on \( I = \text{dom}(v) \cap \text{dom}(w) \), then we write \( v = w \). For \( (u, y) \in \mathcal{V}_a \times \mathcal{V}_a \), the domains of \( u \) and \( y \) may be different; we adopt the convention

\[
\text{dom}(u, y) := \text{dom}(u) \cap \text{dom}(y).
\]

We say \( \mathcal{V} \subset \mathcal{S} \) is a signal space if, and only if, it is a vector space and has the property that \( \sup_{\tau \geq 0} ||T_\tau v||_V < \infty \) implies \( v \in \mathcal{V} \). In our applications, frequently \( \mathcal{V} \) will be the normed signal space \( W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \), in which case, \( \mathcal{V}_e = W^{1,\infty}_{loc}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \), \( \mathcal{V}_\omega = W^{1,\infty}_{loc}(0, \omega) \to \mathbb{R}^m \)

for \( \omega \in (0, \infty] \) and \( \mathcal{V}_a = \cup_{0 < \omega \leq \infty} W^{1,\infty}_{loc}(0, \omega) \to \mathbb{R}^m \). It is important to note that \( \mathcal{V}_\omega \supset W^{1,\infty}(0, \omega) \to \mathbb{R}^m \).

For a normed signal space \( \mathcal{U} \) and the Euclidean space \( \mathbb{R}^l \), \( l \in \mathbb{N} \), we will also consider subsets of \( \mathcal{V} = \mathbb{R}^l \times \mathcal{U} \), which, on identifying each \( \theta \in \mathbb{R}^l \) with the constant signal \( t \mapsto \theta \), can be thought of as a normed signal space with norm given by \( ||(\theta, x)||_\mathcal{V} = \sqrt{||\theta||^2 + ||x||^2_\mathcal{U}}. \)

3.2 Well posedness

A mapping \( Q : \mathcal{X}_1 \to \mathcal{X}_2 \) between signal spaces is said to be causal if, and only if, for all \( \tau > 0, x, y \in \mathcal{X}_1 \), \( T_\tau x = T_\tau y \) implies \( T_\tau Q x = T_\tau Q y \). Let \( \mathcal{U} \) and \( \mathcal{Y} \) be normed signal spaces and let \( P : \mathcal{U}_a \to \mathcal{Y}_a \) and \( C : \mathcal{Y}_a \to \mathcal{U}_a \) be causal mappings representing a plant and controller, respectively. Our central concern is the system of equations

\[
[P, C] : \quad y_1 = Pu_1, \quad u_2 = Cy_2, \quad u_0 = u_1 + u_2, \quad y_0 = y_1 + y_2 \quad (3.1)
\]

corresponding to the closed-loop feedback configuration as depicted in Figure 1, see Section 1. By a solution of (3.1) we mean the following. For \( w_0 = (u_0, y_0) \in \mathcal{W} := \mathcal{U} \times \mathcal{Y} \), a pair \( (w_1, w_2) = ((u_1, y_1), (u_2, y_2)) \in \mathcal{W}_a \times \mathcal{W}_a \), \( \mathcal{W}_a := \mathcal{U}_a \times \mathcal{Y}_a \), is a solution of (3.1) if, and only if, (3.1) holds on \( \text{dom}(w_1, w_2) \). The (possibly empty) set of all solutions is denoted by

\[
\mathcal{X}_{w_0} := \{ (w_1, w_2) \in \mathcal{W}_a \times \mathcal{W}_a \mid (w_1, w_2) \text{ solves (3.1)} \}.
\]

The closed-loop system \( [P, C] \), given by (3.1), is said to have:

- the existence property if, and only if, \( \mathcal{X}_{w_0} \neq \emptyset \);
- the uniqueness property if, and only if,

\[
\forall w_0 \in \mathcal{W} : \quad \left[ (\tilde{w}_1, \tilde{w}_2), (\hat{w}_1, \hat{w}_2) \in \mathcal{X}_{w_0} \Rightarrow (\hat{w}_1, \hat{w}_2) = (\tilde{w}_1, \tilde{w}_2) \right. \quad \text{on } \quad \text{dom}(\hat{w}_1, \hat{w}_2) \cap \text{dom}(\tilde{w}_1, \tilde{w}_2).
\]
Assume that \([P, C]\) has the existence and uniqueness properties. For each \(w_0 \in W\), define \(\omega_{w_0}\),
\[0, \omega_{w_0} := \bigcup_{(\hat{w}_1, \hat{w}_2) \in X_{w_0}} \text{dom}(\hat{w}_1, \hat{w}_2),\]
and define \((w_1, w_2) \in W_\alpha \times W_\alpha\), with \(\text{dom}(w_1, w_2) = [0, \omega_{w_0})\), by the property \((w_1, w_2)|_{[0, t]} \in X_{w_0}\) for all \(t \in [0, \omega_{w_0})\). This construction induces the operator
\[H_{P,C} : W \rightarrow W_\alpha \times W_\alpha, \quad w_0 \mapsto (w_1, w_2).\]
The closed-loop system \([P, C]\), given by (3.1), is said to be:

- **locally well posed** if, and only if, it has the existence and uniqueness properties and the operator \(H_{P,C} : W \rightarrow W_\alpha \times W_\alpha, \quad w_0 \mapsto (w_1, w_2)\), is causal;
- **globally well posed** if, and only if, it is locally well posed and \(H_{P,C}(W) \subset W_\varepsilon \times W_\varepsilon\);
- **W-stable** if, and only if, it is locally well posed and \(H_{P,C}(W) \subset W \times W\);
- **regularly well posed** if, and only if, it is locally well posed and
\[\forall w_0 \in W : \left[ \omega_{w_0} < \infty \implies T_{\omega_{w_0}} H_{P,C}(w_0) \notin W \times W \right]. \tag{3.2}\]

If \([P, C]\) is globally well posed, then for each \(w_0 \in W\) the solution \(H_{P,C}(w_0)\) exists on the half line \(\mathbb{R}_{\geq 0}\). Regular well posedness means that if the closed-loop system has a finite escape time \(\omega > 0\) for some disturbance \((u_0, y_0) \in W\), then at least one of the components \(u_1, u_2\) or \(y_1, y_2\) is not a restriction to \([0, \omega)\) of a function in \(U\) or \(Y\), respectively. If \([P, C]\) is regularly well posed and satisfies
\[\forall w_0 \in W : \left[ \omega_{w_0} < \infty \implies T_{\omega_{w_0}} H_{P,C}(w_0) \in W \times W \right],\]
there does not exist a solution of \([P, C]\) with a finite escape time, and therefore \([P, C]\) is globally well posed. However, global well posedness does not guarantee that each solution belongs to \(W \times W\); the latter is ensured by \(W\)-stability of \([P, C]\). Note also that neither regular nor global well posedness implies the other.

### 3.3 Graphs and gain-function stability

In our investigation of robustness of stability properties of a closed-loop system, the concept of graphs and gain-function stability will play a central role. Corresponding to a plant operator \(P\) (respectively, the controller operator \(C\)) is a subset of \(W\), called the *graph* of the plant \(G_P\) (respectively, the controller \(G_C\)), defined as
\[G_P = \left\{ \begin{pmatrix} u \\ Pu \end{pmatrix} \bigg| u \in U, \ Pu \in Y \right\} \subset W, \quad G_C = \left\{ \begin{pmatrix} C y \\ y \end{pmatrix} \bigg| Cy \in U, \ y \in Y \right\} \subset W.\]

Note that we identify \(G_P \ni \begin{pmatrix} u \\ Pu \end{pmatrix} = (u, Pu) \in W\), and analogously for \(G_C\).

A causal operator \(F : X \rightarrow Y_\varepsilon\), where \(X, Y\) are subsets of normed signal spaces, is said to be gain-function stable if, and only if, \(F(X) \subset Y\) and the following nonlinear so-called gain-function is well defined:
\[g[F] : (r_0, \infty) \rightarrow \mathbb{R}_{\geq 0}, \quad r \mapsto g[F](r) = \sup \left\{ \|T_{\tau}Fx\|_Y \bigg| x \in X, \|T_{\tau}x\|_X \in (r_0, r], \tau > 0 \right\}. \tag{3.3}\]
where \(r_0 := \inf_{x \in X} \|x\|_X < \infty\). Observe that \(\|T_{\tau}Fx\|_Y \leq g[F](\|T_{\tau}x\|_X)\). A closed-loop system \([P, C]\) is said to be gain-function stable if, and only if, it is globally well posed and \(H_{P,C} : W \rightarrow W_\varepsilon \times W_\varepsilon\) is gain-function stable.
Note the following facts:

(i) global well posedness of \([P, C]\) implies that \(\text{im } H_{P,C} \subset W_e \times W_e\);

(ii) gain function stability of \([P, C]\) implies \(W\)-stability of \([P, C]\);

(iii) if \([P, C]\) is \(W\)-stable, then \(H_{P,C} : W \rightarrow \mathcal{G}_P \times \mathcal{G}_C\) is a bijective operator with inverse \(H_{P,C}^{-1} : (w_1, w_2) \mapsto w_1 + w_2\).

To see (iii), note that \(H_{P,C}(\mathcal{W}) \subset \mathcal{W} \times \mathcal{W}\) implies that \(H_{P,C}(\mathcal{W}) \subset \mathcal{G}_P \times \mathcal{G}_C\), and since for any \(w_1 \in \mathcal{G}_P \subset \mathcal{W}, w_2 \in \mathcal{G}_C \subset \mathcal{W}\) we have \(w_1 + w_2 \in \mathcal{W}\), it follows that \(H_{P,C}(\mathcal{W}) \supset \mathcal{G}_P \times \mathcal{G}_C\). Therefore, we can think of a gain-function stable \(H_{P,C}\) as a surjective operator \(H_{P,C} : \mathcal{W} \rightarrow \mathcal{G}_P \times \mathcal{G}_C\). The inverse of \(H_{P,C} : \mathcal{W} \rightarrow \mathcal{G}_P \times \mathcal{G}_C\) is obviously \(H_{P,C}^{-1} : (w_1, w_2) \mapsto w_1 + w_2\).

Finally, with a closed-loop system \([P, C]\), we associate the following two parallel projection operators: \(\Pi_{P//C} : \mathcal{W} \rightarrow \mathcal{W}_a, w_0 \mapsto w_1\), and \(\Pi_{C//P} : \mathcal{W} \rightarrow \mathcal{W}_a, w_0 \mapsto w_2\). Clearly, \(H_{P,C} = (\Pi_{P//C}, \Pi_{C//P})\) and \(\Pi_{P//C} + \Pi_{C//P} = I\). Therefore, gain-function stability of one of the operators \(\Pi_{P//C}\) and \(\Pi_{C//P}\) implies the gain-function stability of the other, and so gain-function stability of either operator implies gain-function stability of the closed-loop system \([P, C]\).

### 3.4 The nonlinear gap

The essence of the paper is a study of robust stability in a specific adaptive control context. Robust stability is the property that the stability properties of a globally well-posed closed-loop system \([P, C]\) persists under “sufficiently small” perturbations of the plant. In other words, robust stability is the property that \([P_1, C]\) inherits the stability properties of \([P, C]\), when the plant \(P\) is replaced by any plant \(P_1\) sufficiently “close” to \(P\). In the context of this paper, plants \(P\) and \(P_1\) are deemed to be close if, and only if, their respective graphs are close in the gap sense of [6]. The nonlinear gap is defined as follows:

Let, for signal spaces \(\mathcal{U}\) and \(\mathcal{Y}\),

\[
\Gamma := \{ P : \mathcal{U}_a \rightarrow \mathcal{Y}_a \mid P \text{ is causal} \}
\]

and, for \(P_1, P_2 \in \Gamma\), define the (possibly empty) set

\[
\mathcal{O}_{P_1, P_2} := \{ \Phi : \mathcal{G}_{P_1} \rightarrow \mathcal{G}_{P_2} \mid \Phi \text{ is causal, surjective, and } \Phi(0) = 0 \}.
\]

The directed nonlinear gap \(\hat{\delta}\) is given by

\[
\hat{\delta} : \Gamma \times \Gamma \rightarrow [0, \infty], \quad (P_1, P_2) \mapsto \hat{\delta}(P_1, P_2) := \inf_{\Phi \in \mathcal{O}_{P_1, P_2}} \sup_{x \in \mathcal{G}_{P_1 \times \{0\}}, \tau > 0} \left( \frac{\| T_\tau(\Phi - I)(x) \|_{\mathcal{U} \times \mathcal{Y}}}{{\| T_\tau x \|}_{\mathcal{U} \times \mathcal{Y}}} \right),
\]

with the convention that \(\hat{\delta}(P_1, P_2) := \infty\) if \(\mathcal{O}_{P_1, P_2} = \emptyset\), and the nonlinear gap \(\delta\) is

\[
\delta : \Gamma \times \Gamma \rightarrow [0, \infty], \quad (P_1, P_2) \mapsto \delta(P_1, P_2) := \max\{\hat{\delta}(P_1, P_2), \hat{\delta}(P_2, P_1)\}.
\]

### 3.5 Example

In this sub-section we illustrate the previous graph and gap concepts by two operators \(P_\alpha, P_{N,M,\alpha}\) induced by state space systems

\[
P_\alpha : \begin{cases}
\dot{x} = \alpha x + u_1, & x(0) = x^0 \\
y_1 = x
\end{cases},
\]

\[
P_{N,M,\alpha} : \begin{cases}
\dot{x} = \bar{A} x + \bar{b} u_1, & x(0) = \bar{x}^0 \\
y_1 = \bar{c} x
\end{cases}
\]

(3.5)
for $\alpha > 0$, $x^0 \in \mathbb{R}$ and $(\tilde{A}, \tilde{b}, \tilde{c})$ as in (1.6), $\tilde{\omega}^0 \in \mathbb{R}^3$. Throughout this example assume that $x^0 = 0$, $\tilde{\omega}^0 = 0$. The second purpose of this example is to show that $P_\alpha$ is close to $P_{N,M,\alpha}$ in the sense

$$\limsup_{M \to \infty} \delta(P_\alpha, P_{2M,M,\alpha}) = 0.$$  \hfill (3.6)

First, recall that $(\tilde{A}, \tilde{b}, \tilde{c}) \in \mathcal{P}_{3,1}$, $\tilde{M}_{3,1}$ and $(\alpha, 1, 1) \in \mathcal{M}_{1,1}$.

Secondly, recall that the graphs of $P_\alpha$ and $P_{N,M,\alpha}$ are given, respectively, by

$$\mathcal{G}_{P_\alpha} = \left\{ \begin{pmatrix} u_1 \\ y_1 \end{pmatrix} \mid u_1, y_1 \in W^{1,\infty}([0,\infty)) \right\}, \quad \mathcal{G}_{P_{N,M,\alpha}} = \left\{ \begin{pmatrix} u_1 \\ y_1 \end{pmatrix} \mid u_1, y_1 \in W^{1,\infty}([0,\infty)) \right\}.$$  

To determine an upper bound for the gap between $P_\alpha$ and $P_{N,M,\alpha}$, consider the bijective mapping $\Phi$ from graph $\mathcal{G}_{P_\alpha}$ to graph $\mathcal{G}_{P_{N,M,\alpha}}$ given by

$$\Phi : \mathcal{G}_{P_\alpha} \to \mathcal{G}_{P_{N,M,\alpha}}, \quad \left( \int_0^t e^{\alpha(-s)} u(s) \, ds \right) \mapsto \left( \frac{e^{\alpha(-s)}}{c} \int_0^t e^{\tilde{\alpha}(-s)} \tilde{b} u(s) \, ds \right).$$

By the definition of the nonlinear gap, see Section 3.4, we obtain

$$\delta(P_\alpha, P_{N,M,\alpha}) \leq \sup_{w \in \mathcal{G}_{P_\alpha} \setminus \{0\}} \frac{\| \Phi(w) - I(w) \|_{\mathcal{W}}}{\| w \|_{\mathcal{W}}}.$$  

where $\mathcal{W} := W^{1,\infty}([0,\infty)) \times W^{1,\infty}([0,\infty))$ and, for $w = (u, y) \in \mathcal{W}$, the norm is defined by

$$\| (u, y) \|_{\mathcal{W}} := \| u \|_{W^{1,\infty}([0,\infty))} + \| y \|_{W^{1,\infty}([0,\infty))}.$$

To estimate

$$\| (\Phi - I)(w)(t) \| \quad \text{for} \quad w := \left( \int_0^t e^{\alpha(-s)} u(s) \, ds \right) \in \mathcal{G}_{P_\alpha}$$

we calculate that the output $y_1$ of (3.5) is given, for all $t \geq 0$, by

$$y_1(t) = \tilde{c} \int_0^t e^{\tilde{\alpha}(t-s)} \tilde{b} u_1(s) \, ds$$

$$= \int_0^t \frac{N(M - \alpha)}{(\alpha + N)(\alpha + M)} e^{\alpha(t-s)} u_1(s) \, ds + \int_0^t \frac{N(N + M)}{(N - M)(\alpha + N)} e^{-N(t-s)} u_1(s) \, ds$$

$$+ \int_0^t \frac{-2NM}{(N - M)(\alpha + M)} e^{-M(t-s)} u_1(s) \, ds$$

and thus, for all $t \geq 0$,

$$\| (\Phi - I)(w)(t) \| \leq \left| \left( \frac{N(M - \alpha)}{(\alpha + N)(\alpha + M)} - 1 \right) \int_0^t e^{\alpha(t-s)} u(s) \, ds \right|$$

$$+ \left( \left| \int_0^t e^{-N(t-s)} u(s) \, ds \right| + \left| \int_0^t e^{-M(t-s)} u(s) \, ds \right| \right) \| u \|_{L^{\infty}([0,\infty))}$$

$$\leq \left| \left( \frac{N(M - \alpha)}{(\alpha + N)(\alpha + M)} - 1 \right) \int_0^t e^{\alpha(t-s)} u(s) \, ds \right|$$

$$+ \left( \left| \int_0^t e^{-N(t-s)} u(s) \, ds \right| + \left| \int_0^t e^{-M(t-s)} u(s) \, ds \right| \right) \| u \|_{L^{\infty}([0,\infty))}$$

12
\[ |(Φ - I)(w)(t)| \leq \left| \frac{N(M - α)}{(α + N)(α + M)} - 1 \right| \left\| \int_0^t e^{α(-s)} u(s) \, ds \right\|_{W^{1,∞}([R_0 → R])} \]

\[ + \left( \left| \frac{N + M}{(N - M)(α + N)} \right| + \left| \frac{2N}{(N - M)(α + M)} \right| \right) ||u||_{W^{1,∞}([R_0 → R])} \]

Hence

\[ \tilde{δ}(P_α, P_{N,M,α}) \leq \left| \frac{N(M - α)}{(α + N)(α + M)} - 1 \right| + \left| \frac{N + M}{(N - M)(α + N)} \right| + \left| \frac{2N}{(N - M)(α + M)} \right| \]

which yields (3.6).

### 4 Robustness of the λ-tracker

#### 4.1 Well posedness of the closed-loop systems

For \( m,n \in \mathbb{N} \) with \( n \geq m \), consider \( P_{n,m} \) as a subspace of the Euclidean space \( \mathbb{R}^{n^2+2mn} \) by identifying a plant \( \theta = (A,B,C) \) with a vector \( \theta \) consisting of the elements of the plant matrices, ordered lexicographically. With normed signal spaces \( U_λ \) which yields (4.1) and (4.2), respectively, the closed-loop initial value problem \( \tilde{W} \tilde{R} \tilde{̇} \tilde{R} \) of any plant of the form (1.1) (with associated operator \( \tilde{P}(θ, x^0) \)) and adaptive controller (1.5) (with associated operator \( \tilde{C}(λ, k^0) \)), where \( (θ, x^0) \in P_{n,m} \times \mathbb{R}^n \) and \((λ, k^0) \in \mathbb{R}_0^+ \times \mathbb{R}_0^+ \) is regularly well posed. Furthermore we show that, for \( θ \in M_{n,m} \), the closed-loop system \([\tilde{P}(θ, x^0), \tilde{C}(λ, k^0)]\) is globally well posed and \((U \times Y)\)-stable.

**Proposition 4.1** Let \( m,n \in \mathbb{N} \) with \( n \geq m \), \( λ > 0 \), \((θ, x^0, k^0) \in M_{n,m} \times \mathbb{R}^n \times \mathbb{R} \) and \( u_0, y_0 \in W^{1,∞}([R_0 → R^m]) \). Then, for plant operator \( \tilde{P}(θ, x^0) \) and control operator \( \tilde{C}(λ, k^0) \), given by (4.1) and (4.2), respectively, the closed-loop initial value problem \([\tilde{P}(θ, x^0), \tilde{C}(λ, k^0)]\), given by (1.8), (1.2), (1.5), is globally well posed and \((W^{1,∞}([R_0 → R^m]) × W^{1,∞}([R_0 → R^m]))\)-stable.

**Proof.** The proposition is a direct consequence of Proposition 2.1

Note that, for \((A,B,C) \in P_{n,m}, x^0 \in \mathbb{R}^n, λ > 0 \) and \( k^0 \in \mathbb{R}, \) the closed-loop initial value problem (1.1), (1.2), (1.5) may be written as

\[
\begin{align*}
\dot{x}(t) &= Ax(t) + B[u_0(t) - u_2(t)], & x(0) &= x^0 \in \mathbb{R}^n, \\
\dot{k}(t) &= d_λ(y_2(t))|y_2(t)|, & k(0) &= k^0 \in \mathbb{R}, \\
y_2(t) &= y_0(t) - Cx(t), \\
u_2(t) &= - k(t)y_2(t),
\end{align*}
\]

where \( d_λ \) is defined in the Nomenclature.
Proposition 4.2 Let $m, n \in \mathbb{N}$ with $n \geq m$, $\lambda > 0$, $(\theta, x^0, k^0) \in \mathcal{P}_{n,m} \times \mathbb{R}^n \times \mathbb{R}$ and $u_0, y_0 \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)$. Then, for plant operator $\tilde{P}(\theta, x^0)$ and control operator $\tilde{C}(\lambda, k^0)$, given by (4.1) and (4.2), respectively, the closed-loop initial value problem $[\tilde{P}(\theta, x^0), \tilde{C}(\lambda, k^0)]$, given by (4.3), has the following properties:

(i) there exists a unique maximal solution $(x, k) : [0, \omega) \to \mathbb{R}^n \times \mathbb{R}$, for some $\omega \in (0, \infty]$;

(ii) if $k \in W^{1,\infty}([0, \omega) \to \mathbb{R})$, then $\omega = \infty$;

(iii) if $y_2 \in W^{1,\infty}([0, \omega) \to \mathbb{R}^m)$, then $\omega = \infty$;

(iv) $[\tilde{P}(\theta, x^0), \tilde{C}(\lambda, k^0)]$ is regularly well posed.

Proof. (i): Since the right hand side of (4.3) is continuous and locally Lipschitz, the statement follows from the theory of ordinary differential equations.

(ii): Suppose $k \in W^{1,\infty}([0, \omega) \to \mathbb{R})$ and, for contradiction, $\omega < \infty$. Since $d_\lambda(y_2)^2 \leq d_\lambda(y_2) |y_2| = k \in L^\infty([0, \omega) \to \mathbb{R}_{\geq 0})$, we have $d_\lambda(y_2) \in L^\infty([0, \omega) \to \mathbb{R}_{\geq 0})$ and $d_\lambda(y_2) + \lambda \in L^\infty([0, \omega) \to \mathbb{R}_{\geq 0})$. Thus $y_2 \in L^\infty([0, \omega) \to \mathbb{R}^m)$.

Since $k \in L^\infty([0, \omega) \to \mathbb{R})$, Variation of Constants applied to (4.3) yields the existence of constants $c_0, c_1 > 0$ such that

$$\forall \ t \in [0, \omega) : |x(t)| \leq c_0 \left( e^{c_1 \omega} + \int_0^\omega e^{c(s-\omega)} (|u_0(s)| + |y_2(s)|) \ ds \right). \quad (4.4)$$

Since $y_2 \in L^\infty([0, \omega) \to \mathbb{R}^m)$ and $u_0 \in L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)$, it follows from the convolution in (4.4) that the right hand side of (4.4) is bounded on $[0, \omega)$ which contradicts the maximality of the solution $x$. Hence $\omega = \infty$.

(iii): Suppose $y_2 \in W^{1,\infty}([0, \omega) \to \mathbb{R}^m)$ and, for contradiction, $\omega < \infty$. Then $\dot{k} = d_\lambda(y_2) |y_2| \in L^\infty([0, \omega) \to \mathbb{R})$ and, combined with

$$\forall \ t \in [0, \omega) : \ k(t) = \int_0^t d_\lambda(y_2(s)) |y_2(s)| \ ds \leq \int_0^t \|y_2\|_{L^\infty([0, \omega) \to \mathbb{R}^m)}^2 \ ds = \omega \|y_2\|_{L^\infty([0, \omega) \to \mathbb{R}^m)}^2,$$

we arrive at $k \in W^{1,\infty}([0, \omega) \to \mathbb{R})$. Now (ii) yields that $\omega = \infty$. This is a contradiction and so $\omega = \infty$.

(iv): Let $\mathcal{W} = W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)$. By (i), the closed-loop $[\tilde{P}(\theta, x^0), \tilde{C}(\lambda, k^0)]$ is locally well posed. To prove that $[\tilde{P}(\theta, x^0), \tilde{C}(\lambda, k^0)]$ is regularly well posed, it suffices to show that (3.2) holds. Let $\mathcal{W}$ be a closed-loop system $[\tilde{P}(\theta, x^0), \tilde{C}(\lambda, k^0)]$ with $\mathcal{W}$ maximal. Suppose that $\mathcal{W}$ is maximal. Then we have $y_2 \in W^{1,\infty}([0, \omega) \to \mathbb{R}^m)$, which, in view of (iii), yields $\omega = \infty$. Hence the closed-loop system is regularly well posed.

4.2 Robustness

In Propositions 4.1 and 4.2 we have established that, for $(\theta, x^0, k^0) \in \mathcal{M}_{n,m} \times \mathbb{R}^n \times \mathbb{R}$ and $m, n \in \mathbb{N}$ with $n \geq m$, $\lambda > 0$, $u_0, y_0 \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)$, the closed-loop system $[\tilde{P}(\theta, x^0), \tilde{C}(\lambda, k^0)]$ is globally well posed and has certain stability properties. Furthermore, in Proposition 2.1 $\lambda$-tracking is shown for linear systems belonging to class $\mathcal{M}_{n,m}$.

The purpose of this sub-section is to determine conditions under which these properties are maintained when the plant $\tilde{P}(\theta, x^0)$ is perturbed to a plant $\tilde{P}(\theta, x^0)$ where $(\theta, x^0) \in \mathcal{P}_{q,m} \times \mathbb{R}^q$. The
for some $q \in \mathbb{N}$, in particular when $\bar{\theta} \notin M_{q,m}$. The main result Theorem 4.5 shows that the stability properties and $\lambda$-tracking persist if (a) the plants $\bar{P}(\bar{\theta},0)$ and $\bar{P}(\theta,0)$ are sufficiently close (in the gap sense) and (b) the initial data $\bar{x}^0$ and disturbance $w_0 = (u_0,y_0)$ are sufficiently small.

To establish gap margin results, we will need to construct the augmented plant and controller operators as in [4]. Note that $0 \notin M_{n,m}$. Define $\bar{U} := \mathbb{R}^{n^2+2nm} \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)$ and let $\bar{W} := \bar{U} \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)$, which can be considered as signal spaces by identifying $\theta \in \mathbb{R}^{n^2+2nm}$ with the constant function $t \mapsto \theta$ and endowing $\bar{U}$ with the norm $\|((\theta, u))\|_{\bar{U}} := \sqrt{|||\theta||^2 + ||u||^2_{W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)}}$. For given $\bar{P}(\theta,0)$ as in (4.1), we define the (augmented) plant operator as

$$P : \bar{U}_0 \to W_a^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m), \quad \theta, u_1 \mapsto y_1 = P(u_1) := \bar{P}(\theta,0)(u_1).$$

(4.5)

Fix $\lambda > 0, k^0 \in \mathbb{R}$ and define, for $\bar{C}(\lambda, k^0)$ as in (4.2), the (augmented) controller operator as

$$C : W_a^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \to \bar{U}_a, \quad y_2 \mapsto \bar{u}_2 = C(y_2) := \left(0, \bar{C}(\lambda, k^0)(y_2)\right) .$$

(4.6)

For each non-empty $\Omega \subset M_{n,m}$, define

$$\mathcal{W}^{\Omega} := (\Omega \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)) \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \quad \text{and} \quad H^{\Omega}_{P,C} := H_{P,C}|_{\mathcal{W}^{\Omega}} .$$

(4.7)

It follows from Proposition 4.1 that $H^{\Omega}_{P,C} : \mathcal{W}^{\Omega} \to \bar{W} \times \bar{W}$ is a causal operator for any $\Omega \subset M_{n,m}$. We now establish gain-function stability.

**Proposition 4.3** Let $m,n \in \mathbb{N}$ with $n \geq m$, $k^0 \in \mathbb{R}$, $\lambda > 0$ and assume $\Omega \subset M_{n,m}$ is closed. Then, for the closed-loop system $[P,C]$ given by (3.1), (4.5) and (4.6), the operator $H^{\Omega}_{P,C}$, given by (4.7) is gain-function stable.

**Proof.** For $\nu : D_{n,m} \to \mathbb{R}_{\geq 0}$ as in Proposition 2.1 and $\mathcal{W}^{\Omega}$ given by (4.7), we have

$$\forall (\theta, u_0, y_0) \in \mathcal{W}^{\Omega} : \|H^{\Omega}_{P,C}((\theta, u_0), y_0)\|_{\mathcal{W} \times \mathcal{W}} \leq \|(\theta, u_0), y_0\|_{\mathcal{W}} + 2\|((\theta, u_2), y_2)\|_{\mathcal{W}}$$

$$\leq \|(u_0, y_0)\|_{\mathcal{W}} + 3|\theta| + 2\nu(\theta, (0,k^0), u_0, y_0) ,$$

and so, for $r_0 := \inf_{w \in \mathcal{W}^{\Omega}} \|w\|_{\mathcal{W}}$ and $r \in (r_0, \infty)$, closedness of $\Omega$ yields

$$g\left[H^{\Omega}_{P,C}\right](r) := \sup\left\{\|(u_0, y_0)\|_{\mathcal{W}} + 3|\theta| + 2\nu(\theta, (0,k^0), u_0, y_0) \mid (\theta, u_0, y_0) \in \mathcal{W}^{\Omega}, \|((\theta, u_0, y_0))\|_{\mathcal{W}} \leq r\right\} < \infty .$$

Thus, a gain-function for $H^{\Omega}_{P,C}$ exists, and the proof is complete. \qed

The following proposition establishes $(W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m) \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m))$-stability of the closed-loop system $[\bar{P}(\bar{\theta},\bar{x}^0), \bar{C}(\lambda, k^0)]$ for a system $\bar{\theta}$ belonging to the system class $P_{q,m}$ if, for a system $\theta$ belonging to $M_{n,m}$ and $x^0 \in \mathbb{R}^n$, the gap between $\bar{P}(\bar{\theta},\bar{x}^0)$ and $\bar{P}(\theta,x^0)$, the initial value $\bar{x}^0 \in \mathbb{R}^q$ and the input/output disturbances $w_0 = (u_0,y_0)$ are sufficiently small.
Proposition 4.4 Let $m, n, q \in \mathbb{N}$ with $n, q \geq m$, $\mathcal{U} = \mathcal{Y} = W^{1,\infty}(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^m)$, $\mathcal{W} = \mathcal{U} \times \mathcal{Y}$ and $\theta \in \mathcal{M}_{n,m}$. For $(\tilde{\theta}, \tilde{x}^0, k^0) \in \mathcal{P}_{q,m} \times \mathbb{R}^q \times \mathbb{R}$ and $\lambda > 0$, consider $\tilde{P}(\tilde{\theta}, \tilde{x}^0) : \mathcal{U}_\theta \rightarrow \mathcal{Y}_\theta$, and $\tilde{C}(\lambda, k^0) : \mathcal{Y}_\theta \rightarrow \mathcal{U}_\theta$ defined by (4.1) and (4.2), respectively. Then there exist a continuous function $\eta : (0, \infty) \rightarrow (0, \infty)$ and a function $\psi : \mathcal{P}_{q,m} \rightarrow (0, \infty)$ such that the following holds:

\[
\forall \left(\tilde{\theta}, \tilde{x}^0, w_0, r\right) \in \mathcal{P}_{q,m} \times \mathbb{R}^q \times \mathcal{W} \times (0, \infty) : \\
\psi(\tilde{\theta})|\tilde{x}^0| + \|w_0\|_{\mathcal{W}} \leq r \\
\delta \left(\tilde{P}(\tilde{\theta}, 0), \tilde{P}(\tilde{\theta}, 0)\right) \leq \eta(r) \quad \implies \quad H_{\tilde{P}(\tilde{\theta}, \tilde{x}^0), \tilde{C}(\lambda, k^0)}(w_0) \in \mathcal{W} \times \mathcal{W}. \tag{4.8}
\]

Proof. We need to show how the gain-function stability of the augmented closed loop $[P,C]$, given by (4.5) and (4.6), yields the robustness property (4.8) for the unaugmented closed-loop $[\tilde{P}(\tilde{\theta}, \tilde{x}^0), \tilde{C}(\lambda, k^0)]$.

By Proposition 4.2 the closed-loop $[\tilde{P}(\tilde{\theta}, \tilde{x}^0), \tilde{C}(\lambda, k^0)]$ is regularly well-posed for all $\tilde{\theta} \in \mathcal{P}_{q,m}$. Consider the augmented operators defined by (4.5) and (4.6), i.e.

\[
P : \mathcal{P}_{n,m} \times \mathcal{U}_\theta \rightarrow \mathcal{Y}_\theta, \quad (\tilde{\theta}, u_1) \mapsto P(\tilde{\theta}, u_1) = \tilde{P}(\tilde{\theta}, 0)(u_1) \\
C : \mathcal{Y}_\theta \rightarrow \mathcal{P}_{n,m} \times \mathcal{U}_\theta, \quad y_2 \mapsto C(y_2) = (0, \tilde{C}(\lambda, k^0)(y_2)).
\]

For $\theta \in \mathcal{M}_{n,m}$ set $\Omega = \{\theta\}$. By Proposition 4.3, $H^\Omega_{P,C} = H_{P,C}|_{\mathcal{W}\Omega}$, given by (4.7), is gain-function stable. By, for example, the proof of Theorem 4.3 in [20], $T_\tau \Pi_{P(\theta, 0)/C(\lambda, k^0)}$ is continuous for all $\tau > 0$, and so $T_\tau \Pi_{P/C}|_{\mathcal{W}\Omega}$ is continuous for all $\tau > 0$.

Then [3, Theorem 5.2] gives the existence of a continuous function $\mu : (0, \infty) \times \Omega \rightarrow (0, \infty)$ such that

\[
\forall (\theta, \tilde{\theta}, w_0, r) \in \Omega \times \mathcal{P}_{q,m} \times \mathcal{W} \times (0, \infty) : \\
\left[\|w_0\|_{\mathcal{W}} \leq r \quad \wedge \quad \delta \left(\tilde{P}(\theta, 0), \tilde{P}(\tilde{\theta}, 0)\right) \leq \mu(r, \theta) \right] \implies H_{\tilde{P}(\tilde{\theta}, \tilde{x}^0), \tilde{C}(\lambda, k^0)}(w_0) \in \mathcal{W} \times \mathcal{W}.
\]

Note that the proof of [3, Theorem 5.2] holds also for the signal space $W^{1,\infty}(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^m)$ although it is proved in [3] for $\mathcal{U} = \mathcal{Y} = L^p(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^m)$, $1 \leq p \leq \infty$.

To prove (4.8) we will use [3, Theorem 5.3]. The statement of [3, Theorem 5.3] has been proved for $\mathcal{U} = \mathcal{Y} = L^p(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^m)$, $1 \leq p \leq \infty$. Adding the simple fact that for any Hurwitz matrix $M \in \mathbb{R}^{n \times n}$, it is $(t \mapsto \exp(M \, t))$, $(t \mapsto \frac{d}{dt} \exp(M \, t)) \in L^\infty(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^{n \times n})$ (the proof also holds for $\mathcal{U} = \mathcal{Y} = W^{1,\infty}(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^m)$)

The statement of [3, Theorem 5.3] for $\mathcal{U} = \mathcal{Y} = W^{1,\infty}(\mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^m)$ yields the existence of a continuous function $\mu : (0, \infty) \times \Omega \rightarrow (0, \infty)$ and a function $\psi : \mathcal{P}_{q,m} \rightarrow (0, \infty)$ such that

\[
\forall (\tilde{\theta}, \tilde{\theta}, \tilde{x}^0, w_0, r) \in \mathcal{P}_{q,m} \times \mathcal{M}_{n,m} \times \mathbb{R}^q \times \mathcal{W} \times (0, \infty) : \\
\psi(\tilde{\theta})|\tilde{x}^0| + \|w_0\|_{\mathcal{W}} \leq r \\
\delta \left(\tilde{P}(\tilde{\theta}, 0), \tilde{P}(\tilde{\theta}, 0)\right) \leq \mu(r, \theta) \quad \implies \quad H_{\tilde{P}(\tilde{\theta}, \tilde{x}^0), \tilde{C}(\lambda, k^0)}(w_0) \in \mathcal{W} \times \mathcal{W}. \tag{4.9}
\]

Finally, statement (4.8) follows on setting $\eta(\cdot) = \mu(\cdot, \theta)$. \qed

Note that [3, Theorem 5.3] requires stabilizability of system $\tilde{\theta} \in \mathcal{P}_{q,m}$.

Finally, we are in the position to state and prove the main result of the present paper. Loosely speaking, we show that the $\lambda$-tracker also works for systems $(\tilde{A}, \tilde{B}, \tilde{C}) \in \mathcal{P}_{q,m}$ which are not
necessarily minimum phase, may have higher relative degree and negative high-frequency gain. However \((A, B, C)\) has to be sufficiently close – in the terms of the gap metric – to a system \((A, B, C) \in \mathcal{M}_{n,m}\) and the initial value \(\tilde{x}^0 \in \mathbb{R}^q\) for \((\tilde{A}, \tilde{B}, \tilde{C})\) and the input/output disturbances \((u_0, y_0)\) have to be sufficiently small.

**Theorem 4.5** Let \(m, n, q \in \mathbb{N}\) with \(n, q \geq m\), \(U = \mathcal{Y} = W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)\), \(W = U \times \mathcal{Y}\), \(k^0 \in \mathbb{R}\), \(\lambda > 0\) and \(\theta \in \mathcal{M}_{n,m}\). For \((\tilde{\theta}, \tilde{x}^0) \in \mathcal{P}_{q,m} \times \mathbb{R}^q\) consider the associated operators \(\tilde{P}(\tilde{\theta}, \tilde{x}^0): U_a \to \mathcal{Y}_a\) and \(\tilde{C}(\lambda, k^0): \mathcal{Y}_a \to U_a\) defined by (4.1) and (4.2), respectively, and the closed-loop initial value problem (1.1), (1.2), (1.5). Then there exist a continuous function \(\eta: (0, \infty) \to (0, \infty)\) and a function \(\psi: \mathcal{P}_{q,m} \to (0, \infty)\) such that the following holds:

\[
\forall \left(\tilde{\theta}, \tilde{x}^0, w_0, r\right) \in \mathcal{P}_{q,m} \times \mathbb{R}^q \times W \times (0, \infty) : \begin{align*}
\psi(\tilde{\theta})|\tilde{x}^0| + \|w_0\|_W &\leq r \\
\tilde{\delta} \left(\tilde{P}(\theta, 0), \tilde{P}(\tilde{\theta}, 0)\right) &\leq \eta(r)
\end{align*} \implies \begin{cases}
k \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}) , \\
\limsup_{t \to \infty} |y_2(t)| &\leq \lambda , \\
x \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^q),
\end{cases}
\tag{4.10}
\]

where \((x, k)\) and \(y_2\) satisfy (4.3).

**Proof.** **Step 1:** We show

\[
((u_1, y_1), (u_2, y_2)) = H_{\tilde{P}(\tilde{\theta}, \tilde{x}^0), \tilde{C}(\lambda, k^0)}(w_0) \in W \times W.
\tag{4.11}
\]

Choose functions \(\eta: (0, \infty) \to (0, \infty)\) and \(\psi: \mathcal{P}_{q,m} \to (0, \infty)\) from Proposition 4.4. Let

\[
\left(\tilde{\theta}, \tilde{x}^0, w_0, r\right) \in \mathcal{P}_{q,m} \times \mathbb{R}^q \times W \times (0, \infty) : \psi(\tilde{\theta})|\tilde{x}^0| + \|w_0\|_W &\leq r \land \tilde{\delta} \left(\tilde{P}(\theta, 0), \tilde{P}(\tilde{\theta}, 0)\right) \leq \eta(r).
\]

Then Proposition 4.4 gives (4.11).

**Step 2:** By Proposition 4.2 it follows that (4.3) has a unique solution \((x, k): [0, \omega) \to \mathbb{R}^q \times \mathbb{R}\) on a maximal interval of existence \([0, \omega)\) for some \(\omega \in (0, \infty]\). Proposition 4.2(iii) yields \(\omega = \infty\).

**Step 3:** We show \(\dot{k} \in L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R})\). Suppose, for contradiction, that \(\dot{k} \notin L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R})\), i.e. there exists a sequence \((t_i) \in (\mathbb{R}_{\geq 0})^N\) with \(t_i > t_{i+1}\) and \(\lim_{i \to \infty} \dot{k}(t_i) = \infty\). Then

\[
\lim_{i \to \infty} d_\lambda(y_2(t_i)) |y_2(t_i)| = \infty
\]

and thus

\[
\lim_{i \to \infty} |y_2(t_i)| = \infty,
\]

a contradiction to Step 1.

**Step 4:** We show \(k \in L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R})\). Suppose, for contradiction, that \(k \notin L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R})\), i.e. \(\lim_{t \to \infty} k(t) = \infty\). Since \(u_2 \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)\), the forth equation in (4.3) yields \(\lim_{t \to \infty} y_2(t) = 0\), and thus

\[
\exists T > 0 \forall t \geq T : \dot{k}(t) = d_\lambda(y_2(t)) |y_2(t)| = 0
\]

which contradicts the assumption on \(k\).

**Step 5:** By Step 3 and 4 we obtain \(k \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R})\).
Step 6: By Proposition 4.4 we have in particular $y_2, \dot{y}_2 \in L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)$. Similar as in Step 10 of the proof of Proposition 2.1, we may establish that $y_2$ is uniformly continuous.

Step 7: By Step 6 and continuity of $e \mapsto d_\lambda(e)|e|$ we obtain that $t \mapsto d_\lambda(y_2(t))|y_2(t)|$ is uniformly continuous. Hence, in view of $k = d_\lambda(y_2)|y_2| \in L^1(\mathbb{R}_{\geq 0} \to \mathbb{R})$, which is equivalent to $k \in L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R})$, and Barbálat’s Lemma, see [1], $\lim_{t \to \infty} d_\lambda(y_2(t))|y_2(t)| = 0$ holds. This gives $\limsup_{t \to \infty} |y_2(t)| \leq \lambda$.

Step 8: It remains to show that $x \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^g)$. Let $(\bar{A}, \bar{B}, \bar{C}) \in \mathcal{P}_{a,m}$ associated with (1.1). Detectability of $(\bar{A}, \bar{B}, \bar{C})$ yields the existence of $F \in \mathbb{R}^{n \times 1}$ such that $\text{spec}(\bar{A} + F \bar{C}) \subset \mathbb{C}_-$. Setting $g := - [F + k \bar{B}] (y_0 - y_2) + \bar{B} u_0 + \bar{B} k y_0$ gives

$$\dot{x} = \left[ \bar{A} - k \bar{B} \bar{C} \right] x + \bar{B} u_0 + \bar{B} k y_0 = \left[ \bar{A} + F \bar{C} \right] x + g.$$  \hspace{1cm} (4.12)

By Proposition 4.4 and Step 5 we have $y_2 \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)$ and $k \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R})$ and since $u_0 = (u_0,y_0) \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^m)$ it follows that $g \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^g)$. Hence, by (4.12) we obtain $x \in L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^g)$. The first equation in (4.3) then gives $\dot{x} \in L^\infty(\mathbb{R}_{\geq 0} \to \mathbb{R}^g)$ which shows $x \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^g)$ and the proof is complete. \hfill $\Box$

Example 4.6 Finally, we revisit example (1.6).

In Sub-section 3.5 we have already shown that for zero initial conditions the gap between the system $(\bar{A}, \bar{b}, \bar{c}) \in \mathcal{P}_{3,1} \setminus \mathcal{M}_{3,1}$ and $(\alpha, 1, 1) \in \mathcal{M}_{4,1}$ tends to zero as $N = 2M$ and $M$ tends to infinity, see (3.6). Now, in view of Theorem 4.5 there exist a continuous function $\eta: (0, \infty) \to (0, \infty)$ and a function $\psi: \mathcal{P}_{3,1} \to (0, \infty)$ such that

$$\forall (\bar{x}^0, w_0, r) \in \mathbb{R}^3 \times \mathcal{W} \times (0, \infty) :$$

$$\psi((\bar{A}, \bar{b}, \bar{c})|\bar{x}^0| + \|w_0\|_{\mathcal{W}} \leq r)$$

$$\delta \left[ \bar{P}_1((\alpha, 1, 1), 0), \bar{P}_2((\bar{A}, \bar{b}, \bar{c}), 0) \right] \leq \eta(r)$$

$$\implies \left\{ \begin{array}{l}
 k \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}), \\
 \limsup_{t \to \infty} |y_0(t) - y_1(t)| \leq \lambda, \\
 x \in W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}^3),
 \end{array} \right.$$

where $\mathcal{W} = W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R}) \times W^{1,\infty}(\mathbb{R}_{\geq 0} \to \mathbb{R})$.

This means in particular that $\lambda$-tracking is achieved by the adaptive control strategy (1.4) applied to system (1.6) despite the fact that it has unstable zero dynamics, has relative degree two and negative high-frequency gain. The only restrictions are that the zero is “far” in the right half complex plane, the initial condition $\bar{x}^0$ is “small” and the $W^{1,\infty}$ input/output disturbances $u_0$ and $y_0$ are “small”, too.
